# Era app

The Era app is a mobile clocking application for smartphone and tablet that your employees can use to clock in and out, or to request absences when they are traveling, working on location or in the office. Perfect when there is no physical time clock on hand.

- fast clocking on any location (while traveling or on locations where is no physical time clock)
- easy absence requests
- clear counter balances overview
- register notes
- receive messages
- register activities
- accessible for smartphone and tablet.

SDP Era: Clocking & time management software

SDP Era is efficient, powerful and intuitive software including five different modules: time management, self-service module, time management, access control and task management. The modules are available separately or as a package. The software is fully accessible throught internet, as well as through hosting.

Time management

The SDP time registration software includes various options: creating daily schedules, registering presence, closing and exporting data, printing reports, etc. The software provides a personalized set up of working arrangements and regulations and flexible absence management. You can also produce extensive reports and easily send the data to your payroll administration.

Fixed and flexible working hours
Easily follow up complex schedules easily. Choose the agenda layouts. You even have the opportunity to manage more than one contract/task per employee.

Self-service module

Employees can use this module to get an overview of counters, performances and the department's schedule at a home workstation or in the office. Employees clock, request absences or request schedule changes using a workstation in your internal network, a clocking station, tablet or a home pc.

Time management

A growing number of employees work according to variable schedules, which must take into account individual working arrangements, shifts, working hours and social legislation. Availability, experience and employee references and minimum occupation are also important.

Time management support
You have access to all important employee create schedules. You will be able to verify whether all staff requirements have been met at a single glance on the schedule board. That's why our planning software indicates all regulations, working agreements and in-house rules when planning a schedule. You will have a clear overview of counters and balances.

Integration with other modules
The combination with time registration (SDP Era time-IT) will save you lots of calculations at the end of each month. Data are collected for you and can be easily submitted to your payment administration.

Access control

SDP Era is an electronic key system management that guarantees access control for different doors both inside and outside, as well as gates, barriers and elevators. Each employee or visitor has access to certain areas by means of a coded badge, within or outside predefined (working) hours.

Safety
The presence board shows who is where in the building at a glance. You can also request the history of badges used at checkpoints. Using electronic badges replaces complex key management. The risk of copied keys completely disappears.

Task management

With SDP Era you follow the performances of various projects closely. You measure how much time is spent on a task, taking into account the type of work and workforce, as well as the equipment used. The processed data is linked to your ERP package for further processing and cost (center) calculation.
